PROFESSIONAL SUMMARY

Rust Software Engineer with 1.5 year of commercial backend experience building reliable APIs and data-intensive services with Rust, Axum, Tokio, Diesel, and PostgreSQL. Experienced in API contract design, authentication, transactional persistence, and service boundaries. Delivers maintainable solutions through pragmatic engineering decisions, clear communication, and end-to-end ownership.

EXPERIENCE

Software Engineer | *Noldor Solutions — Caffeine*

Feb 2023 — Feb 2024

Geosocial platform connecting coffee shops, roasteries, and coffee lovers

- Owned backend delivery from an early product stage, implementing Rust services and REST APIs used by web and mobile clients with Axum, Tokio, Diesel, and PostgreSQL.
- Defined stable API contracts and service boundaries for client-to-service and service-to-service communication.
- Designed a schema-driven polymorphic forms API covering dynamic definitions, validation, typed serialization, submissions, and PostgreSQL persistence without hardcoded client-specific form variants.

SELECTED PROJECTS

Software Engineer — Maintainer | [gridstack](#)

Apr 2026 — Present

Open-source Matrix-compatible homeserver backend in Rust

- Design and maintain a non-federated Matrix Client-Server API with authentication, room creation, membership, authorization, and /sync event delivery.
- Implemented rate-limited registration and login with JWT authentication, session isolation, device binding, and conservative credential-error handling.
- Built transactional event persistence with prev/auth links, event depth, DAG consistency, and idempotent client transactions.
- Created an AST-based generator that derives OpenAPI contracts directly from Rust source without manual annotations.

Navigation Systems Engineer | *Higher League Robotics Hackathon*

2024 · 2-day event

TurtleBot3 navigation system built by a three-person team

- Designed and tuned a Python/ROS 2 path-tracking system with PID control, integrating navigation with hardware and computer-vision components.
- Improved trajectory stability and reduced route completion time by approximately 15%, helping the team place second.

SKILLS

Backend: Rust | Tokio | Axum | Diesel | PostgreSQL | SQL | REST API Design | OpenAPI | Authentication & Authorization | Transactional Systems | Distributed Systems

Engineering: Docker | Linux | Git | CI/CD

EDUCATION

RANEPA

BSc in Applied Informatics in Information Security

2026

Moscow, Russia
